15th of April, 2026

Dataset Overview

This dataset contains life expectancy at birth values across multiple countries, regions, and World Bank income groups from 2000 to 2021.

Initial Observations

- ▶ The dataset spans multiple years and covers multiple countries.
- ▶ It contains **12,936 records**, providing a broad view of global life expectancy trends.
- ▶ No duplicates or missing values were identified during the cleaning process.
- ▶ It contains some redundant columns that were removed to improve data quality and simplify analysis.

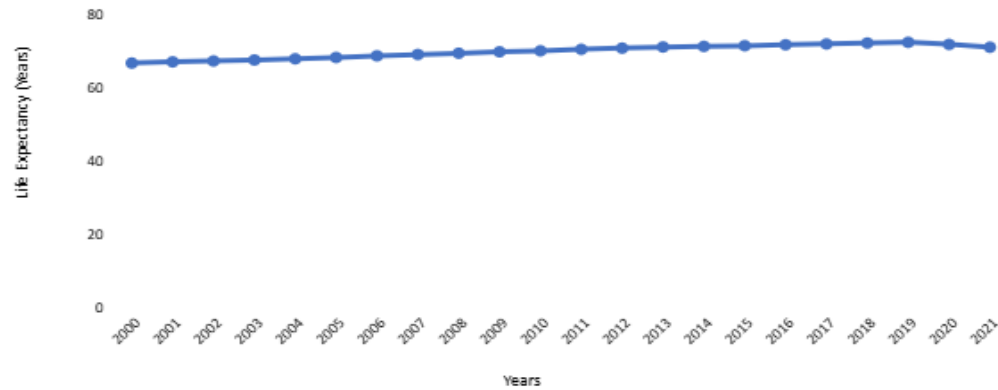

Questions

The key questions explored were:

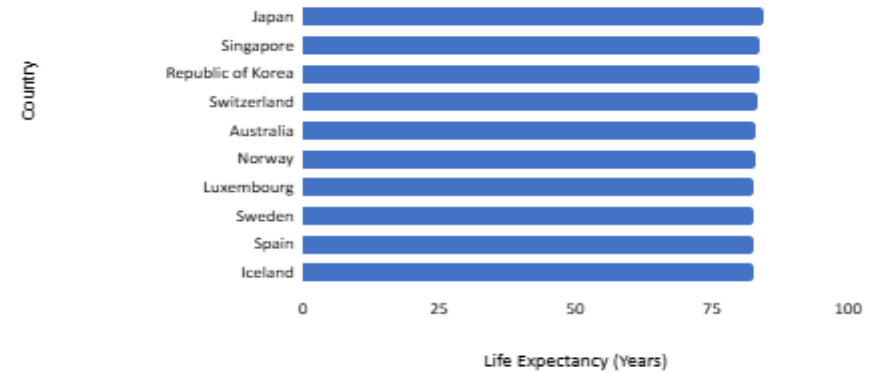

1. How has global life expectancy changed over time?
2. Which country has the highest and which has the lowest life expectancy in the most recent year (2021)?
3. How does life expectancy vary across World Bank income groups?

Bottom 10 Countries by Life Expectancy (2021)

Life Expectancy by World Bank Income Group

Insights

1. Global life expectancy shows a steady increase from 2000 to around 2019, followed by a noticeable decline towards 2020 and 2021.
 2. Japan had the highest life expectancy while Lesotho had the lowest life expectancy in 2021.
 3. Life expectancy increases consistently with income level, with high-income countries showing the highest values.
- There is a clear disparity in life expectancy across countries and income groups, indicating uneven global health outcomes.

Limitations

- ▶ Some column names were unclear and difficult to interpret.
- ▶ No metadata was provided to explain variable definitions.
- ▶ The dataset focused mainly on life expectancy values and lacked supporting variables such as healthcare access, GDP, or mortality indicators that could explain observed patterns.
